considered as a serious disease.

In Japan, from 1872 when the smallpox vaccine became compulsory, the number of people infected with smallpox continually increased each year. In 1892, more than 160,000 people had developed smallpox, and from this 30,000 people died. All of them had been vaccinated against smallpox. Technically in Japan in 1976, the smallpox vaccine was terminated, and in 1980 the "Declaration for the eradication of smallpox" was announced.

However this declaration is suspected as having been a smoke screen in order to show the vaccination as something great and to acclaim the modern medical science. It has shielded our eyes from the suspicion that the smallpox vaccine may itself have been the true cause of prolonging the existence of the disease until that time which would otherwise already have been extinguished by itself, and also blinds us from the fact that the vaccine has caused such a huge amount of damage to the health of the large number of people, bringing an enormous misery upon them.

The warning of Burnett

Compton Burnett, a doctor who lived 100 years ago, had warned, "Vaccination against smallpox may reduce the numbers of people who contract it, however it will increase

The History of Vaccination 109

its mortality rate." He had also proven through his clinical experiences that the diseases caused by the smallpox vaccine are of a far wider range than we could imagine. He called diseases caused by vaccine "Vaccinosis."

He warned;

"Chronic vaccinations more particularly lies completely beyond the ken of ordinary medicine, and although it will sometimes turn up in literature as "ill-effects of vaccination," it is, nevertheless, but an unrecognized waif, much to the disadvantage of suffering mankind and of medical science. It has not yet been sufficiently studied to be readily defined; except casually, indeed, its very existence is not generally admitted••(omission of a middle part)••Some may, perhaps, say that vaccinosis is the same as vaccinia; this is, however, not so; vaccinosis is vaccinia and something more, for if a person is vaccinated unsuccessfully he has not had vaccine, whereas some of the worst cases of (my) vaccinosis which I have met with were just those in whom the vaccination did not "take," as the saying goes. Hence I must call attention to what I believe is a fact, viz.: that it often does take deep hold of the constitution without calling forth any local phenomena, and, not only so, but such cases may be even very severe in their internal developments, manifested by the supervention of various morbid symptoms after vaccination." (citation from "Vaccinosis and its Cure by Thuja with remarks on

110

Homeoprophylaxis by J. Compton Burnett, M.D." - other citations below are also from the same source.)

I believe that what is stated here is absolutely true. After having a vaccination, if no skin rashes develop in the vaccinated area, then it means that the toxins of that vaccine have not been eliminated, which is a situation wherein pathogens are still lodged in the blood stream, that is to say, it is a serious chronic state which is unable to develop the acute symptoms of smallpox which may then manifest itself in later years in the form of various chronic symptoms. The typical case of this would be cancer.

Burnett further warns;

"Let us dwell on a little on this novel assertion, I was going to say fact, yet probably very few will admit that it is a fact at all, but only a fad of mine, since everybody holds that if the vaccination does not "take" the individual has remained uninfluenced by the process of putting vaccine under the cuticle. In other words, when a person is vaccinated and does not take; is in fact, unsuccessfully vaccinated, it is held that said person is proof against vaccination, and we certify accordingly. Every one believes that the unsuccessfully vaccinated individual has not in any way been affected or altered by the vaccination. CLOSE AND MINUTE

The History of Vaccination III

OBSERVATION, HOWEVER, TEACHES ME THAT SUCH IS BY NO MEANS NECESSARILY THE CASE, FOR NOT A FEW PERSONS DATE THEIR ILL HELTH FROM A SO-CALLED INSUCCESSFUL VACCINATION. My own conception of the thing is just this: The vaccinated person is poisoned by the vaccine virus; what is called the "taking" is, in point of fact, the constitutional re-action whereby the organism frees itself more or less from the inserted virus. If the person do not "take" , AND THE VIRUS HAS BEEN ABSORBED, the "taking" becomes a chronic process paresis, neuralgia, cephalalgiae, pimples, acne, & c. The less a person "takes," therefore (in such a case), the MORE is he likely to suffer from chronic vaccinosis, i.e., from the genuine vaccination disease in its chronic form, very frequently a neuralgia or paresis.

Most practitioners will agree that neuralgia is more prevalent now than ever before within the present age, and experience has forced me to ascribe many such cases to vaccinosis. If my colleagues object to my aetiopathology of such neuralgia, perhaps they will favour as with a more satisfactory one. The word 'neuralgia' covers such a multitude of sins in the world of nosology and pathology that my hypothesis is as exact science compared therewith!"

The disease whose name is "neuralgia" will shield the real
